

## Front-End Engineer

Are you passionate about the front end? Are you an expert at both Javascript and HTML/CSS? Do you value elegant, snappy UI, efficient code, and amazing user experiences? Then Leads360 wants you—now.

You will be the first dedicated front-end engineer at Leads360. Your insight and suggestions will shape our client-side code for years to come. This is a full-time, on-site position.

What you will NOT do: graphic design or wireframing. If you can do that stuff, cool; but we already have a graphic designer and our product team handles wireframes and specs.

Here's your first duties:

Code-review our Dialer Heads-Up-Display (it has lots of client-side code):

- Is the markup good? If not, work your magic.
- Is our javascript good? If not, refactor it.
- How can we improve its performance? Optimize the heck out of it.

Code-review our “View Leads” page (it's the main list of data items):

- How can we reduce the page size? Make it happen.
- Convert from heavy use of page refreshes to heavy use of ajax.
- Are we assigning client-side events well? If not, refactor.

Code-review other client-side code in the site. Make suggestions. Get your hands dirty. Re-UX the crap out of everything.

Those code reviews will generate a LOT of work for you to do, we're sure, since the whole app was written by back-end engineers.

It's like Google's recent UI/UX transformation, you know. They finally let a UI/UX person take control and re-UX Google's apps. That's what we want to do with our app: the LeadManager.
